#### Objective/Problem

The study investigates how advanced English language learners use mobile devices (smartphones and tablets) to enhance their language learning experiences. It aims to understand the engagement of learners with these technologies and their implications for meeting personal learning goals.

#### Background

Recent years have seen a surge of interest among researchers in the role of mobile devices in education, particularly in language learning. The convenience and accessibility of mobile technology present opportunities for individualization and autonomy in learning. However, the relationship between learner autonomy and mobile device usage remains underexplored, necessitating a deeper understanding of how advanced learners utilize these resources.

#### Methods

The research involved semi-structured interviews with 20 Polish university students studying English philology. The participants included students from both undergraduate (BA) and graduate (MA) programs, with varying levels of English proficiency. Data collection employed qualitative and quantitative analysis methods, focusing on students’ experiences, motivations, and practices when using mobile devices for language study.
